# Outline

- ❑ **Some examples of low data quality**
- ❑ **A model of acidification of the Baltic Sea**
- ❑ **Observational pH and alkalinity data from the Baltic Proper**
- ❑ **General comments on tools for change-point detection and trend assessment**

# Trend curve for temperature-normalized concentrations of phosphorus along with measured concentrations at different depths (0.5 – 70 m) at Dagskärsgrundet in Lake Vänern

# Trend surface for normalized concentrations of total phosphorus in riverine input to the Gulf of Bothnia

Normalization with respect to discharge and transport of particulate matter

# Trend curves for the arithmetic mean of normalized concentrations of phosphorus in riverine input to the Kattegat/Skagerrak and the Gulf of Bothnia

Normalization with respect to discharge and transport of particulate matter

# Trend surface for flow-normalized concentrations of total nitrogen in riverine input to the Kattegat and Skagerrak

(Tot-N concentrations determined by persulphate digestion)

# Trend surface for flow-normalized concentrations of total nitrogen in riverine input to the Kattegat and Skagerrak

(Tot-N concentrations determined as the sum of nitrite/nitrate nitrogen and Kjeldahl nitrogen)

# Trend curves for the arithmetic mean of flow-normalized concentrations of total nitrogen in rivers discharging into the Kattegat and Skagerrak

Tot-N (ps) = total nitrogen determined by persulphate digestion

Tot-N (Kj) = sum of nitrite/nitrate nitrogen and Kjeldahl nitrogen

# Acidification of the Baltic Sea

- ☐ Increased CO<sub>2</sub> levels in the atmosphere can lower the pH of weakly buffered waters
- ☐ It has been stated that the pH of sea water has decreased 0.1 units during the past century
- ☐ The effect of increasing CO<sub>2</sub> levels can be modified by changes in the input of nutrients to the Baltic Sea

# Modelled pH in the Baltic Proper 1960-2006, surface water (0-10 m)

Anders Omstedt, GU

# Modelled pH in the Baltic Proper 1960-2006, surface water, winter data (Jan-Mar)

Anders Omstedt, GU

# Mann-Kendall tests of trends in modelled pH in the Baltic Proper

1960-2006

# Comparison of observational and modelled pH data – BY15 and the Baltic Proper

# Visual inspection of observational data

Data from BY15  
In the Baltic Proper

# Major achievements in visual data analysis

- ❑ Interactive linked diagrams (Becker & Cleveland, 1987; [www.Ggobi.org](http://www.Ggobi.org))
- ❑ Motion charts (Rosling; [www.gapminder.org](http://www.gapminder.org); Google gadget; VB-macros for Excel)

# Statistical tools for assessing the quality of environmental data

- ☐ **Trend surface methodologies**
- ☐ **Change-point detection**
- ☐ **Detection of abrupt changes in the presence of smooth trends**

# Assessing time series of data one by one for the presence of abrupt level shifts

# Assessing multiple time series of data for the presence of synchronous smooth changes

# Assessing multiple time series of data for the presence of smooth changes and break points

# A general semiparametric model for smoothing a vector of time series with similar trends and synchronous change-points

Let  $y_{tj}$  be the observed value in the  $j$ th series at time  $t$

Assume that

$$y_t = \alpha_t + \sum_{k=1}^p (x_{kt} - \bar{x}_k) \beta_k + \gamma_t + \varepsilon_t, \quad t = 1, \dots, n$$

Deterministic  
"smooth" trend  
surface

Impact of  
covariate

Change-point

Error  
term

Impose constraints on the variability of the intercepts by penalizing nonlinear variation in these coefficients

# Computational aspects

- ❑ Use a back-fitting algorithm that alternates between
  - i. Estimation of a smooth trend surface in the presence of a given set of change-points
  - ii. Detection and estimation of level shifts in the presence of a given smooth response surface
- ❑ Estimate the smooth trend using a roughness penalty technique allowing smoothing over time and across series
- ❑ Estimate level shifts by first using a tree algorithm to identify candidate change-points and then using dynamic programming for the final detection and estimation of level shifts

# Two-stage search for change-points

- ❑ Identification of candidate change-points using a tree algorithm

- ❑ Final estimation of change-points (identification of a relevant subset of the candidate changepoints)

# Dynamic programming for optimal segmentation of a univariate time series

## □ Basic equation for dynamic programming

$$c(1, t, k) = \min_{0 \leq s < t} \{c(1, s, k-1) + h(s+1, t)\}, 1 \leq t \leq T, 1 \leq k \leq K$$

Min. cost of joining  
segments 1 to t into k  
blocks

Min. cost of joining  
segments 1 to s into  
k-1 blocks

Heterogeneity of the  
last block

## □ Determine $c(1, t, k)$ recursively for $1 \leq t \leq T$ and $1 \leq k \leq K$

# Optimal segmentation of a multivariate time series into $K$ blocks

## □ Basic equation for dynamic programming

$$C(1, m, K) = \min_{1 \leq k_m \leq K - m + 1} \{C(1, m - 1, K - k_m) + C(m, m, k_m)\}$$

Min. segmentation cost for  $K$  blocks in series 1 to  $m$

Min. segmentation cost for  $K - k_m$  blocks in series 1 to  $m - 1$

Min. segmentation cost for  $k_m$  blocks in series  $m$

## □ Determine $C(1, m, K)$ recursively for $1 \leq m \leq M$ and $1 \leq K \leq K_{max}$

# Inputs and outputs of our integrated algorithm

---

# Concluding remarks

- ❑ **Interactive visualization techniques provide new indispensable tools for data analysis**
- ❑ **Semiparametric smoothing techniques can provide a useful basis for the analysis of multiple time series of environmental data**
- ❑ **Analysis of large datasets requires efficient algorithms**
